      - ii. Where the faces are not equal in size, but the interior angle formed by the faces is less than 45 degrees and the two faces are not more than five (5) feet apart, the larger sign face shall be used as the basis for calculating sign area.
      - iii. When the interior angle formed by the faces is greater than 45 degrees, or the faces are greater than five (5) feet apart, all sides of such sign shall be considered in calculating the sign area.
  4. Signs that consist of, or have attached to them, one or more three-dimensional or irregularly shaped objects, shall have a sign area of the sum of two adjacent vertical sign faces of the smallest cube encompassing the sign or object.
  5. If elements of a sign are movable or flexible, such as a flag or banner, the measurement is taken when the elements are fully extended and parallel to the plane of view.
  6. The permitted maximum area for all signs is determined by the sign type and the zoning district in which the sign is located (see §17.38.130, 17.38.140, 17.38.150, 17.38.160, and 17.38.170)
- D. Sign height.
1. Sign height shall be measured as the distance from the highest portion of the sign to the mean finished grade of the street closest to the sign. In the case of a sign located greater than 100 feet from a public street, height shall be measured to the mean grade at the base of the sign.
  2. Clearance for freestanding and projecting signs shall be measured as the smallest vertical distance between finished grade and the lowest point of the sign, including any framework or other structural elements.
  3. The permitted maximum height for all signs is determined by the sign type and the zoning district in which the sign is located (see §17.38.130, 17.38.140, 17.38.150, 17.38.160, and 17.38.170).
- E. Sign spacing: the spacing between sign structures shall be measured as a straight-line distance between the closest edges of each sign.
- F. Sign illumination.
1. Signs may be illuminated, unless otherwise specified herein, consistent with the following standards:

- a. Location. The summary table below (§17.38.060.f.7.) Provides detailed information about what types of illumination are permitted in each zoning district.

    - iii. Each sign must have a light sensing device that will automatically adjust the brightness of the display as the natural ambient light conditions change to comply with the limits set here within.
  - f. Message duration: the length of time each message may be displayed on a message center sign, digital display, or tri-vision board sign is based upon the visibility and speed limit unique to individual signs and adjacent road conditions. The following method should be used to calculate message duration for message center signs, digital displays, or tri-vision board signs:
    - i. Determine the greatest distance from which the sign becomes visible on the road the sign is primarily intended to serve. If a sign is intended to be seen by more than one roadway, the road with the lower posted speed limit shall be used for determining message duration.
    - ii. Multiply the road's posted speed limit (mph) by 5,280, and then divide by 3,600 to obtain the speed limit in feet/second.
    - iii. Divide the visibility distance by the speed limit (feet/second).
    - iv. Add an additional ten (10) percent of this number to the total.
    - v. The resulting amount of time is the minimum permitted message duration, except where this value is less than eight (8) seconds in which the minimum message duration shall be no less than eight (8).
2. Types of illumination: where permitted, illumination may be:
- a. External: externally illuminated signs, where permitted, are subject to the following regulations:
