Annual Consumer Confidence Report

For the Reporting Period January 1, 2019 to December 31, 2019

We are pleased to present this year’s Annual Consumer Confidence Report. This report is designed to inform you about the quality of the water we deliver to you. Our constant goal is to provide you with a safe and reliable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. If you have any questions regarding this report please feel free to contact us at 209-257-5243. If you would like to learn more, you can view our webpage at www.amadorwater.org or please feel free to attend any of our regularly scheduled board meetings. These meetings are held the 2nd and 4th Thursday of every month at 12800 Ridge Road in Sutter Creek.

Espanol – (Spanish): Este informe contiene información muy importante sobre su agua beber. Traduzcalo o hable con alguien que lo entienda bien.

Water Sources
The North Fork of the Mokelumne River, located in the Sierra Nevada Mountains, is the primary water source for the Buckhorn (BH) water system, the Amador Water System (AWS), and the PG&E Tiger Creek Powerhouse system. The Tiger Creek micro filtration plant draws its water supply from Tiger Creek, a small tributary to the Mokelumne River and serves the PG&E Tiger Creek Power House and Conference Center. Water from the Mokelumne River is also treated at our Buckhorn micro filtration plant for use by the customers of Pine Grove, Pine Acres, Sunset Heights, Fairway Pines, Jackson Pines, Pioneer, Rabb Park, Gayla Manor, Ranch House Estates, Toma Lane, and Sierra Highlands. Water from the Mokelumne River also supplies the Amador transmission pipeline to the Tanner Reservoir and Tanner Water Treatment Plant where it is treated for use by the customers of Jackson, Sutter Creek, Amador City, Drytown, and Plymouth. The Ione Pipeline transports raw water from the Tanner Reservoir to the Ione Water Treatment Plant where it is treated for use by the customers of Ione. Our LaMel Heights customers get their water from two wells located in the LaMel Heights Subdivision and our Lake Camanche residents get their water from four wells located in the Lake Camanche area.

Water Quality Assurance Testing and Monitoring
The Amador Water Agency routinely monitors for contaminants in your drinking water in accordance with Federal and State laws. Unless otherwise indicated, the results contained in this report are for the monitoring period of January 1, 2019 to December 31, 2019. This report contains results from laboratory testing, excluding contaminants that were not detected, or that were detected at a level below the State’s DLR (Detection Level for purposes of Reporting). However, if the DLR is exceeded for one system, the results for that contaminant will be shown for all systems utilizing the same source of treatment. Drinking water, including bottled drinking water, may reasonably be expected to contain small amounts of some contaminants. The presence of some contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA’s Safe Drinking Water Hotline at 1-800-426-4791, or log on to www.epa.gov/safewater.

Test Results
The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include: Microbiological contaminants, such as viruses and bacteria that may come from septic systems, agricultural operations (livestock), and wildlife; Inorganic contaminants, such as salts and...
metals, either naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming. Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses; Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, agricultural application, and septic systems. Radioactive contaminants, that can be naturally-occurring or a result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the State Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

**Source Water Assessments**

An assessment of the Tiger Creek After bay was completed in 2001. The source is considered most vulnerable to illegal dumping and shooting at the old quarry site. Chemicals are stored at the powerhouse. There are nearby sewage disposal systems for residential and commercial use.

An assessment of the Sutter Creek water system drinking water source (Amador Canal from Lake Tabeaud to Tanner Reservoir) was completed in May 2001. The source is considered most vulnerable to the following activities: Large animal grazing, pesticide/fertilizer storage, transfer areas in the Watershed and recreational area adjacent to the surface water source (Lake Tabeaud).

An assessment of the drinking water source for LaMel Heights Water System was completed in March 2006. The source is considered most vulnerable to the following activities: Septic Systems.

An assessment of Buckhorn drinking water source (Tiger Creek Reservoir) was completed in December 2001. The source is considered most vulnerable to the following activities: Recreational Areas on Surface Water Source, Managed Forests and Utility Stations in the watershed.

An assessment of the lone drinking water source (Ione Reservoir) was completed in 2007. The source is considered most vulnerable to the following activities: Grazing (>5 large animals or equivalent/acre), railroads and storm drain discharge.

An assessment of Well 06 in Improvement District #7 (Lk Camanche) Unit 6 was conducted in May 2001. The source is considered most vulnerable to the following activities not associated with any detected contaminant: Automobile Gas stations.

An assessment of Well 09 in Improvement District #7 (Lk Camanche) Unit 6 was completed in May 2001. The source is considered most vulnerable to the following activities not associated with any detected contaminants: Other Animal Operations.

An assessment of Well 12A (replaced 12) in Improvement District #7 (Lk Camanche) Unit 6 was completed in May 2001. The source is considered most vulnerable to the following activities not associated with any detected contaminants: Wastewater Treatment Plants. An assessment of Well 14 in Improvement District #7 (Lk Camanche) was completed in March 2007. The source is considered the most vulnerable to the following activities not associated with any detected contaminants: Other Animal Operations and Agricultural Drainage.

The source assessments are available for review at the California Department of Public Health office at 31 E. Channel St Rm 270, Stockton CA. 95202, or the Amador Water Agency administrative offices located at 12800 Ridge Rd Sutter Creek, CA or visit us on the web at www.amadorwater.org. *You may request a summary of the assessment be sent to you by contacting Rick Ferreia at 209-257-5284*

**Definition of Terms**

CalEPA - California Environmental Protection Agency - California’s environmental authority. This Cabinet level agency houses several departmental agencies committed to protecting California's air, land, and water resources.

Cryptosporidium - is a microbial pathogen that can cause an abdominal infection with symptoms such as nausea, cramps, and diarrhea.

EPA - Environmental Protection Agency - A United States governmental agency created to protect human health and safeguard the natural environment.

Grains per Gallon (gpg) - Used to determine the hardness of water based on the concentration of grains per gallon of calcium and/or magnesium. A typical aspirin equals about five grains of material. If the aspirin were dissolved in a gallon of water it would add five grains of “aspirin” to the gallon of water.

Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. Primary MCL’s are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.
Maximum Contaminant Level Goal - The “goal” (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDGL) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDGLs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Nephelometric Turbidity Unit (NTU) - Nephelometric turbidity unit is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person. We monitor it because it is a good indicator of water quality. High turbidity can hinder the effectiveness of disinfectants.

Non-Detects (ND) - Laboratory analysis indicates that the contaminant is not detectable at the testing limit.

Parts per billion (ppb) or Micrograms per liter - One part per billion corresponds to one minute in 2,000 years, or a single penny in $10,000,000.

Parts per million (ppm) or Milligrams per liter (mg/l) - One part per million corresponds to one minute in two years, or a single penny in $10,000.

Presence/Absence (PA) - When testing to find the presence or absence of an element, mineral or contaminant, the test results will be positive (presence) or negative (absence), no quantities determined.

Primary Drinking Water Standard (PDWS) - MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Public Health Goal (PHG) - The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Regulatory Action Level - The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements that a water system must follow.

Secondary Drinking Water Standards (SDWS) - MCLs for contaminants that affect taste, odor or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL level.

Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water.

System Violations Title 22: None to Report

Health Issues

In California, drinking water standards known as "Maximum Contaminant Levels" or "MCL," are set in two categories, primary and secondary. Primary Standards are set to protect the public from substances in water that may be immediately harmful or affect their health if consumed for long periods of time (70+ Years). Test results indicating levels above these standards require immediate action by the water supplier. Secondary Standards relate to aesthetic qualities such as taste, mineral content, odor, and clarity. These standards specify limits for substances that may influence consumer acceptance of water.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice from their health care providers about drinking water. USEPA/Center for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

**Total Coliform Bacteria**: Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other potentially harmful bacteria may be present. Coliforms found in more samples than allowed is a warning of potential problems.

**Fecal Coliform and E. Coli**: Bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Microbes in these wastes can cause short term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a special health risk for infants, young children, some of the elderly and people with severely compromised immune systems.

**Copper**: Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time may experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years may suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor.

**Lead in Schools Testing**: All the state preschools in AWS's service area were tested in 2018 and all were in compliance.

**Lead**: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The above listed water utilities are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours you can minimize the potential for lead exposure by flushing your service line for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline 1-800-726-4791 or at http://www.epa.gov/safewater/lead.

Turbidity has no health effects. However, high levels of turbidity can interfere with disinfection and provide a medium for microbial growth. Turbidity may indicate the presence of disease-causing organisms. These organisms include bacteria, viruses, and parasites which can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.
